

1. Introduction

The ONGC Enterprise Document Indexing & Retrieval System is a centralized platform designed to enable authorized users to search, retrieve, and manage enterprise documents efficiently.

The system provides secure access to indexed documents through metadata-driven search capabilities, dataset-based access controls, and user-specific permissions.

Key features include:

Enterprise document search

Metadata-based filtering

Dataset-specific access control

User activity monitoring

Administrative management tools

CPF-based authentication

2. Logging Into The System

Users can access the platform using their CPF number and password.

Steps

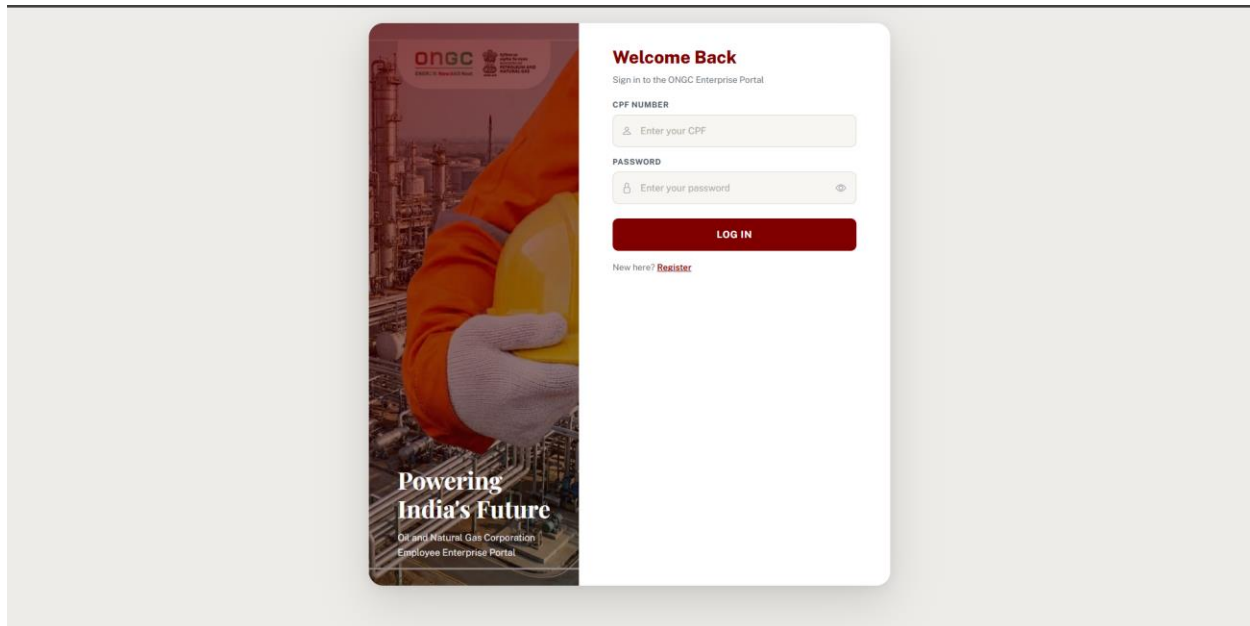

Open the ONGC Enterprise Portal.

Enter your CPF Number.

Enter your Password.

Click Login.

Upon successful authentication, the Dashboard page will be displayed.

3. User Registration

New users must register before accessing the system.

Registration Process

Open the Registration page.

Enter:

Full Name

Department

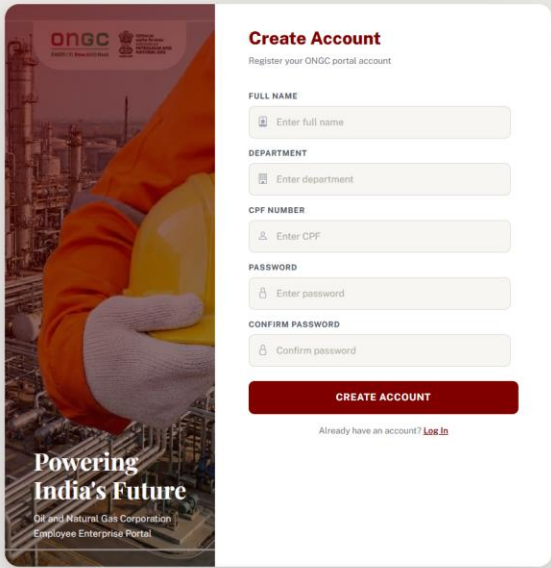

CPF Number

Password

Confirm Password

Click Create Account.

New registrations remain pending until approved by an administrator.

4. Dashboard Overview

The Dashboard provides an overview of system activity and document statistics.

Users can view:

Total indexed documents

Indexed document status

User statistics

Navigation options

The dashboard serves as the primary landing page after login.

5. Document Search

The Document Search module is the core component of the system.

Users can perform searches across authorized datasets using keywords and metadata filters. 5.1 Basic Search

Users may enter one or more keywords in the search box.

Examples:

maintenance

inspection

pipeline

procurement

The system searches across all authorized document metadata and returns matching results.

5.3 Dataset Filtering

Users may restrict searches to specific datasets.

Benefits:

Faster result discovery

Reduced result volume

Improved search accuracy

5.4 Metadata Filtering

Metadata filters allow users to narrow results further.

Depending on permissions, available metadata may include:

Asset ID

Department

Location

Revision

Status

Project

Year

Document Type

Multiple filters may be combined for more precise searches.

6. Search Results

Search results display all matching documents available to the current user.

Displayed information may include:

File Name

Asset ID

Location

Department

Status

Revision Information

Users may click View to open document details.

7. User Permissions

The system enforces role-based security.

Users may receive different search results depending on:

Dataset permissions

Metadata visibility permissions

Assigned access policies

As a result, two users searching for the same keyword may receive different results.

This behavior is intentional and ensures compliance with access restrictions.

8. Viewing Documents

Authorized users may open documents directly from search results.

Document details may include:

File metadata

Associated project information

Asset information

Department details

Additional indexed attributes

Access is restricted to authorized users only.

9. Frequently Asked Questions

Why do different users receive different search results?

Access permissions vary by user. Search results are filtered according to assigned permissions.

Can I access all datasets?

No. Dataset access is assigned by administrators.

How do I request additional access?

Contact your system administrator.

Can I search multiple keywords?

Yes. The search engine supports multi-keyword searches.

Who approves new accounts?

System administrators approve all registration requests.
